

PDF Parser LLM Cleanup Test

Purpose

This English document tests deterministic PDF extraction and LLM cleanup of noisy vocabulary candidates.

The ideal CSV should keep real vocabulary terms and remove names, variable names, code identifiers, file names, IDs, and

Target Vocabulary Section

machine learning machine learning machine learning machine learning

parser parser parser parser extraction extraction extraction extraction

token token token corpus corpus corpus embedding embedding embedding

vector vector vector matrix matrix matrix gradient gradient gradient

inference inference inference retrieval retrieval retrieval

pipeline pipeline normalization normalization architecture architecture

repository repository aggregate aggregate adapter adapter service service domain domain

translation translation alignment alignment frequency frequency vocabulary vocabulary

Inflected Forms Section

The system uses tools, used tools, and is using tools during tests.

The parser parses documents and parsed documents before the final parse.

The pipeline normalizes text, normalized text, and is normalizing text repeatedly.

Named Entity And Term Disambiguation Section

Li Hua generated a file named "wordApp," which mentions Bayes' theorem.

The ideal cleanup removes Li, Hua, Li Hua, and wordApp, but keeps Bayes' theorem as a technical term.

Noise Section: People Names That Should Be Removed

Alice Johnson met Bob Smith near John Williams and Mary Brown.

Dr. Emily Davis emailed Michael Wilson, Sarah Miller, David Moore, and Laura Taylor.

The names Alice, Bob, John, Mary, Emily, Michael, Sarah, David, and Laura are not vocabulary targets.

Noise Section: Variables, Functions, Classes, And Constants That Should Be Removed

tempScore maxRetries userID sessionToken rawTextBuffer parsedHTMLNode HTTPRequestHandler JSONParserFactory

calculateScore updateUserProfile parsePDFPage normalize_text cleanVocabularyCandidates VECTOR_SIZE MATRIX_R

file_path output_csv debugFlag isReady hasError retry_count batch_id request_id

Noise Section: Files, Paths, URLs, And IDs That Should Be Removed

C:/Users/alice/project/input_report_v2.pdf ./runtime/cache/tmp_42.csv https://example.com/report?id=ABC123

commit a1b2c3d4 ticket WORD-942 build_2026_05_24 model-v1.2.3

Validation Notes

A non-LLM extraction pass may include some noisy candidates from the noise sections.

The LLM cleanup pass should remove those noisy candidates while preserving the target vocabulary terms above.
